

## Microdermabrasion

An excellent option for keeping your skin youthful. This scientifically proven technique removes layers of dead skin allowing for a fresher more radiant look to come through. This is most beneficial in conditions where skin is asphyxiated, clogged, hyper pigmented, sun damaged, sallow or in need of rejuvenation. While efficiently removing dead cells from the top of the epidermis, it stimulates cell turnover to provide a more youthful appearance. Usually six to ten treatments are required and there is no "downtime" associated with this clinical treatment. Microdermabrasion can be coupled with peels to enhance its effectiveness.
