

Chemical Peels

Superficial epidermal peels can help resurface the skin and bring back a healthy glow. Peels vary in strength and blends and each treatment is different for each patient. Lactic acid peels refresh and hydrate dry or mature skin. Salicylic acid unclogs pores and encourages the skin to breathe while normalizing sebum production. Glycolic acid renews and restores hyper pigmented or sun damaged skin. Peels can be done alone or when appropriate, can be combined with microdermabrasion.
